ABSTRACT

Nowadays, the introduction of home virtual assistants like Alexa Echo or Google Home became a practice, just considering that over 27% of families owns one.

It's obvious that those devices simplified the life by creating a smart house with few money; but what's the impact these devices have on people privacy? There are a lot of cases in the United States in which the judge asked to Amazon to provide the recording done by the Echo Dot in order to find helpful evidences for the case; so, the question is: "It's possible to prevent the sending of sensible informations to the servers when the weak word is not pronounced?"

In this project we will profile each packet exchanged between the Alexa Echo and the Server in order to classify the nature of the packets and consequentially we will use a machine learning model to discover when the Echo Dot is sending an inappropriate packet.

KEYWORDS

data analytics, alexa, packets profiling

1 INTRODUCTION

2 ALEXA ARCHITECTURE & SECURITY

The Alexa architecture isn't really easy to explain, we will resume just the keypoint in order to better understand the main functionalities for our purpose.

- (1) Alexa is always in listening waiting for the weak word to be pronounced to start the recording of the voice;
- (2) From the weak word, till the end of commands, Alexa will record the speech and partially sends it to Amazon's servers to be analyzed;
- (3) Amazon will process the audio and breaks the command into individual sounds. It then consults a database containing various words pronunciations to find which words most closely correspond to the combination of the individual sounds.
